

# Infix Server Readme

## Getting Started

Included with the Infix Server distribution are a number of sample XML Command Files. These can be found in the directory ExampleXMLCommandFiles. Each of the XML files contained within this directory is commented to describe its function. Using these in conjunction with this [Infix Server Manual](#) is an excellent way of learning how to use and set up Infix Server. The XML Command files supplied use relative paths to files where required and should be run from the directory containing the infixserver executable in the following manner. To generate a default config file run.

```
infixserver
```

Now run

```
Infixserver -c default.cfg -d ExampleXMLCommandFiles/<example.xml> -l  
results.xml
```

Where the <example.xml> is the name of an xml file in the ExampleXMLCommandFiles directory. PDFs produced will be generated in the ExampleXMLCommandFiles directory.

For more detailed information about Infix Server please refer to the [Infix Server Manual](#) included with this distribution.
